

Description of web service go4lunch and price

The **go4lunch** web app serves Users to organize joint lunches on weekdays. The application also serves to record the payment of lunches between Users within individual groups created by the Administrator. The rules of organizing lunches are such that one day a User organizes and pays a lunch for the entire group. Based on the payment made, a User who has organized and paid lunch for other Users is given a score, numerically expressing the number of people for whom the User paid the lunch on a particular day. If a User on a particular day of lunch does not participate in his score with respect to other Users, he / she remains unaffected. To pay for lunches to other Users, the web application always selects the User from the group with the lowest score, which historically paid for the smallest number of other Users. The lunch price within the web application is not decisive and its registration is only informative. **This service is provided free of charge to Administrators and Users.**

For Customers (restaurants), the **go4lunch** web application is used to promote their restaurants, especially to publish their lunch menus. On the **go4lunch** site, the Customers' lunch menu is published and automatically displayed to Users around the restaurant. Additionally, bids appear on the **go4lunch** home page to all visitors who enter their geographic location or agree to locate their communications device. The Customer can edit the daily menu via his account at any time. This service for Customers is charged. **The cost of this service is \$1 (one US Dollar) for each day of advertising. This price is exclusive of VAT. Service can be ordered for a single day/s or for a selected period.**
